The seabed (also known as the seafloor, sea floor, ocean floor, and ocean bottom) is the bottom of the ocean. All floors of the ocean are known as 'seabeds'. The structure of the seabed of the global ocean is governed by plate tectonics. Most of the ocean is very deep, where the seabed is known as the abyssal plain. Seafloor spreading creates mid-ocean ridges along the center line of major ocean ...

functional group will be affected by ocean acidification. In general, higher trophic levels, including most finfish, will likely be sensitive to ocean acidification through changes in the quantity or composition of the food available, although there may be direct physiological effects on some fish species at high pCO₂ (see Chapter 3). The difficulty in predicting ecosystem change is compounded ...

The largest sea is the Mediterranean Sea. The area of Mediterranean sea is approximately 1.14 million square miles. The largest Ocean is the Pacific Ocean with an area of approximately 60 million square miles. The smallest Ocean is the Arctic Ocean covering an area of 5.4 million square miles. Seas are usually located close to land.

Due to the maritime features discussed later in this chapter, the U.S. has the largest EEZ in the world, totaling 3.4 million square nautical miles. The EEZ's size derives from the large coastlines on the Atlantic Ocean, the Gulf of Mexico, the western continental U.S., Alaska, Hawaii and many small outlying Pacific islands.

In other words, it flows downhill along the gradient of the cave floor (Figure 14.9). Many limestone caves also extend below the water table and into the saturated zone. Here water behaves in a similar way to any other groundwater, and it flows according to the hydraulic gradient and Darcy's law. Figure 14.9 Groundwater in a limestone karst ...

As is evident from Figures 18.2 and 18.3, the sea floor is dotted with chains of seamounts, isolated seamounts, and ocean islands. Almost all of

these features are volcanoes, and most are much younger than the oceanic crust on which they formed. Some seamounts and ocean islands are formed above mantle plumes, the best example being Hawaii.

18.2 The Geology of the Oceanic Crust - Physical Geology

The figure below represents a cross section of the sea floor through a mid-ocean rift valley, with alternating patches of black and white indicating sea floor with reversed magnetic polarities. At the arrow labeled "I" (the rift valley), the igneous rock of the sea floor is so young that it can be accurately dated using carbon-14 dating.

To map the ocean floor we need to know the depth at a number of places. The process of measuring the depths is known as bathymetry . These measurements were first made through soundings , where a weighted line (lead line) was let out by hand until it touched the bottom, and the depth could be recorded from the length of the line (Figure 1.4.1).

1.4 Mapping the Seafloor - Introduction to Oceanography

The ocean floor is sometimes called the final frontier of the modern era. Though people have traveled on the ocean for millennia, people have explored only a tiny fraction of the ocean floor. We know very little about the vast expanse of our oceans. ... Look at Figure 14.23. If you follow the ocean floor out from the beach at the top left, ...
