based on difference eigenvalue has been proposed [16]. It showed that the value of the difference eigenvalue edge indicator changes obviously corresponding to the homogeneous blocks or the fine texture blocks. Thus, in this paper, we focus on the noise variance estimation using this difference eigenvalue edge indicator.

Effective image noise removal based on difference eigenvalue

Based on the eigenvalues of the Hessian matrix, the difference eigenvalue manifest itself in terms of structural information of an image. We adapt the new edge indicator to a diffusion model to achieve a better balance between noise removal and detail preservation.

based detection utilizes the cyclic frequency of the PUS [12]-[16]. It performs well when the SNR is very low, but it costs considerable computational complexity. Covariance-based detection [17] and eigenvalue-based detection [18] can overcome the noise uncertainty, but the detection performance is insufficient at low SNR.

n_i is gaussian noise. One common assumption is that n_i is additive white Gaussian noise (AWGN) with zero means and variance 2. In recent years, some patch-based methods have been studied for the Gaussian noise removal problem [8].
