Like most engineering schemes in geography, there's hard and soft coastal engineering. As usual, hard engineering techniques are high technology, high cost, human made solutions. They do little to work with nature and sustainability is a key issue with them, despite their initial signs of success.

Soft engineering. Soft engineering can be a more sustainable, long-term and potentially more cost-effective approach to coastal defence, working with natural processes to protect the shoreline. Techniques include:  
Beach replenishment: This involves the importing of beach-grade sediments to 'top up' beaches.
